

State of the Services

FY 2026 Q1 Report

October 2025 - December 2025

Engagement Events Highlights

World Magnetic Model Summit Meeting

Boulder, Colorado | December 9-10

- NCEI held a World Magnetic Model (WMM) Summit Meeting, gathering scientists, sponsors, and stakeholders to review performance of the WMM 2025 models, evaluate the status of the WMM program, and discuss ongoing and future NCEI research studies in support of the WMM.
- The WMM is the standard model used by the U.S. government and North Atlantic Treaty Organization for navigation, attitude, and heading reference systems using the geomagnetic field. It is also widely used by the aerospace, energy, and consumer electronics industries.

American Geophysical Union Annual Meeting

New Orleans, LA | December 11-19

- Members of NCEI participated in the annual meeting of the American Geophysical Union (AGU). This meeting brought together over 25,000 scientists from over 100 countries and covered a multitude of topics, including space weather, earth, oceanic, and atmospheric sciences.
- NCEI staff led several sessions and presented progress on new products and data delivery mechanisms designed to support industry users as they mitigate the impacts of weather and climate extremes.

Product and Services Highlights

Visualization of Significant Tsunami Events

In collaboration with the Pacific Tsunami Warning Center (PTWC), NCEI-Cooperative Institute for Research In Environmental Sciences scientists updated the Natural Hazards Map Viewer with new Selected Significant Tsunami Events, including the recent July 2025 tsunami off of the Kamchatka peninsula in Russia. NCEI's Global Historical Tsunami Database contains over 3,000 tsunami events, available for discovery on the map viewer. Selected events display associated tsunami energy plots computed using the PTWC's Real-Time Forecasting of Tsunamis forecast model, as well as tsunami travel time contours calculated by using Tsunami Travel Times software. The addition of modelled data to the historical event data provides users with a better understanding of tsunami behavior.

Baseline Sea Level Indicators For Coastal Flood Monitoring

NCEI, in collaboration with the University of Hawai'i's Sea Level Center, developed a foundational set of baseline water-level climatologies and indicators code library to support coastal flood monitoring, prediction, and resilience. The library is a shared, open-source repository of documented computer code, funded by the Bipartisan Infrastructure Law and submitted to the National Ocean Service Center for Operational Oceanographic Products and Services in September 2025. This library drives the creation of a diverse suite of water-level indicator products, forming a critical tool for building national capacity in disaster preparedness.

New Regional Climate Center Products

NOAA's Regional Climate Centers (RCCs) recently released new products and updates to meet the needs of regional climate information users. The High Plains RCC added additional features to their Station Data Explorer and Wind Climatology tools. The Midwestern RCC released an updated, public version of cli-MATE, including modernized code, a new user interface, and updated mapping techniques. The Northeast RCC released beta versions of new tools utilizing hourly data in the Applied Climate Information System, including wind chill, heat index, and consecutive hours of extremes. The Southeast RCC expanded the Wet Bulb Globe Temperature Tool to include the U.S. Caribbean. The Southern RCC enhanced the Integrated Water Portal to include new indices and added additional datasets, as well as the capability to overlay precipitation tools. Lastly, the Western RCC developed a new gridded climatology web tool, Grid Viewer, which includes a gridded wind climatology providing monthly wind speed and wind gust climatologies.

Stakeholder Highlights

An update to the State of the Flood: Helene Story Map was published by NCEI, describing the analyses of fluvial and pluvial flood events across the United States. Particular emphasis was placed on the impact of Hurricane Helene in the Southeast U.S. with further attention on western North Carolina. The story map accompanied significant engagement with the goal of aiding regional preparedness. The update was also picked up by several major news outlets.

NCEI staff partnered with the National Weather Service to introduce NOAA's essential new precipitation frequency product to water resource leaders from across the country. This national standard, NOAA Atlas 15, provides critical data for water resource practitioners to better plan for intense and increasingly frequent storms. Presentations at multiple engagements were held to educate key stakeholders and ensure floodplain managers and decision-makers understand how the new product incorporates nonstationarity, reflecting changing precipitation trends.

A virtual temperature workshop was hosted by NCEI's Climate Extreme Index team, advancing collaboration with the Architecture and Engineering sector. This event connected industry professionals with new temperature data products and essential research. The session featured air freezing index research, a focus group on temperature projection, and demonstrations of the Typical Meteorological Year tool and Climate Atlas site. Participants provided resource needs, helping to shape future NOAA products and services.

NESDIS held a space weather panel at the 2025 AGU annual meeting about the importance of NOAA data in the scientific domain and the difference between operational and scientific data. The panel focused on increasing the uses and value of NOAA data within the Operations to Research to Operations cycle. Audience engagement included discussions about NOAA specific data products, the process of getting external data into the operational stream, improvements of data assimilation into models, and data access.

Upcoming Engagement

American Meteorological Society Annual Meeting	Jan. 25-29
Reinsurance Association of America Cat Risk-Management Conference	Feb. 23-26
Mesophotic and Deep Benthic Communities Annual Meeting	Feb. 23-27

Customer Reach

NCEI Makes Data Accessible

- 1.6B web hits and 3.6k TB of data delivered online*

U.S. Sectors Served

- Top Sectors

Unique Customer Requests

Leaf Area Index (LAI) Dataset Request:

NOAA's LAI Dataset was requested using the Rapid Evaluation Framework (REF) for inclusion in the Intergovernmental Panel on Climate Change Assessment Report. The REF provides performance assessment of climate models and is built upon existing model evaluation packages which provide either a selection of observational datasets or instructions to prepare the dataset for model evaluation. Approval was granted for usage of the dataset, and the data was converted and submitted for inclusion within the Earth System Grid Federation.

Support for Wildfire Investigation:

NCEI provided weather data and fire-related text products for a Department of Justice investigation and litigation surrounding the 2020 Complex Fire in northern California. Data for Trinity County was provided from NCEI archives, which included winds, relative humidities, red flag warnings, and other fire-relevant information.
